

Communication

Date	30 june2026
Team ID	
Project Name	Rising Waters: Smart AI Flood Prediction System
Maximum Marks	1 Mark

Communication Plan:

Effective communication is essential for a successful project demonstration. This document outlines the communication strategy used within the team and with stakeholders throughout the project lifecycle, including how updates, issues, and feedback were managed.

S.No	Communication Type	Frequency	Channel / Tool	Participants	Purpose
1	Team Standup	Daily	Slack / WhatsApp	All Team Members	Track daily progress on features, assign data preprocessing tasks, and clear alignment blockers.
2	Progress Update	Weekly	Zoom / MS Teams	All Team Members & Project Coordinator	Present model evaluation logs (XGBoost vs KNN metrics) and update project task cards
3	Issue / Bug Discussion	As Needed	GitHub Issues / Discord	Technical Developers (G. Jaya Prakash, Y. R.kiran)	Debug runtime errors inside the Flask endpoint routing and fix model load state issues.
4	Stakeholder Review	Bi-Weekly	MS Teams	Team Lead & Evaluators / Mentors	Demonstrate intermediate software builds and align deployment specifications for IBM Cloud.
5	Final Demo Rehearsal	Once	MS Teams	All Team Members	Conduct end-to-end integration dry runs of scenarios 1, 2, and 3 to ensure flawless delivery.
6	Technical Sync	Twice a Week	Google Meet	Feature Engineering Subgroup	Validate dataset features, handle data skewness, and audit data processing choices.

Communication Challenges & Resolutions:

S.No	Challenge Faced	Resolution / Action Taken
1	Asynchronous Code Merging Conflicts: Team members experienced branch divergence while simultaneously merging Jupyter Notebook files and Flask backend endpoints.	Standardized a Git flow strategy with explicit branching rules. Separated predictive logic modules (.py files) completely from template frontend components.
2	Remote Tracking of Model Performance: Difficulty in documenting and sharing historical experiment parameters across distinct local modeling environments.	Created a centralized shared configuration file where training results, performance arrays, and model hyperparameters were logged programmatically.
3	Misaligned Interface Definitions: Frontend design templates built out of sync with structural output payloads coming from the ML inference engine.	Defined strict data contract specifications for the prediction route inputs and outputs before writing backend service functions.
